

# Hello World

#### **New Line**

The escape sequence  $\n$  (backward slash and the letter n) generates a new line in a text string.

## **Program Structure**

The program runs line by line, from top to bottom:

The first line instructs the compiler to locate the file that contains a library called <code>iostream</code> . This library contains code that allows for input and output.

The main() function houses all the instructions for the program.

# Basic Output

std::cout is the "character output stream" and it is used to write to the standard output. It is followed by the symbols << and the value to be displayed.

#### **Compile Command**

Using GNU, the compilation command is  $\,_{g++}$  followed by the file name. Here, the name of the source file is **hello.cpp**.

# **Execute Command**

The execution command is ./ followed by the file name. Here, the name of the executable file is **a.out**.

# **Single-line Comments**

Single-line comments are created using two consecutive forward slashes. The compiler ignores any text after // on the same line.

```
std::cout << "Hello\n";
std::cout << "Hello again\n";

#include <iostream>
int main() {
   std::cout << "1\n";
   std::cout << "2\n";
   std::cout << "3\n";
}</pre>
```

```
g++ hello.cpp
```

std::cout << "Hello World!\n";</pre>

```
./a.out
```

```
// This line will denote a comment in C++
```

## **Multi-line Comments**

code cademy

Multi-line comments are created using  $\ /* \$  to begin the comment, and  $\ */ \$  to end the comment. The compiler ignores any text in between.

/\*
This is all commented out.
None of it is going to run!
\*/
